## DESCRIPTION

The DS1817 EconoReset uses a precision temperature reference and comparator circuit to monitor the status of the power supply ( $V_{CC}$ ). When an out-of-tolerance condition is detected, an internal power fail signal is

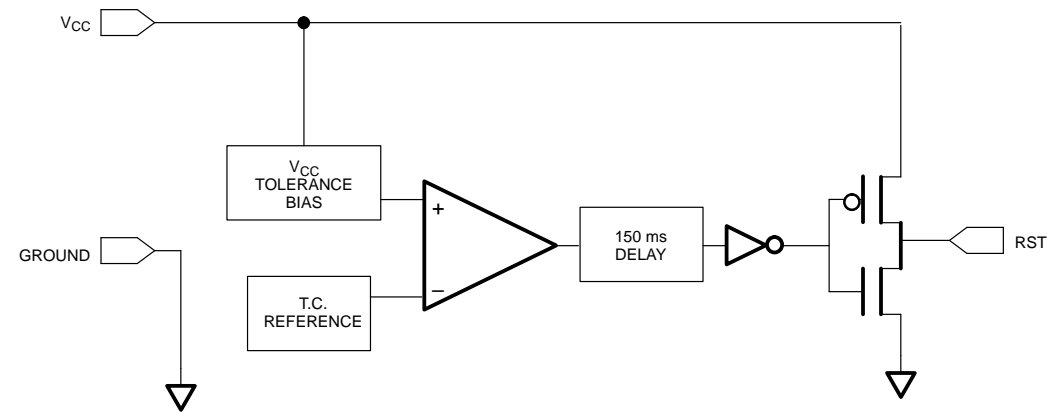

generated which forces reset to the active state. When  $V_{CC}$  returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 150 ms to allow the power supply and processor to stabilize.

**OPERATION – POWER MONITOR**

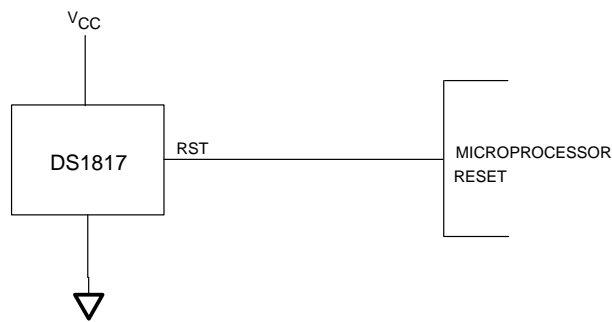

The DS1817 provides the function of detecting out-of-tolerance power supply conditions and warning a processor based system of impending power failure. When  $V_{CC}$  is detected as out-of-tolerance, the RST signal is

asserted. On power-up, RST is kept active for approximately 150 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before RST is released.
